

CLIMATE OUTLOOK FOR 2015 SUMMER SEASON IN SERBIA

May 04th, 2015

Mean summer seasonal temperatures above the **climatological 1981-2010** average are likely to occur. All three individual months have high probability for warmer-than-average conditions. Uncertainties in regional predictions are larger for precipitation than for temperature. The probabilities for below-, near- or above- normal conditions are approximately equal in whole Serbia. It must be emphasized that it might be possible that some parts, especially mountainous ones, might locally have near- or above-normal summer season totals, due to episodes of the enhanced convection with high intensity rainfall.

Probability for summer season temperature 2 m (%)	Probability for summer season precipitation (%)
Above normal (20, 40, 40) in the northern part of the country	No predictive signal (33, 34, 33) in the whole country
Above normal (30, 35, 35) in most of Serbia	

The numbers in brackets from left to the right are related to the values of meteorological parameters for: below-, near- and above- normal.
