

## CLIMATE OUTLOOK FOR 2016 SUMMER SEASON IN SERBIA

April 21<sup>st</sup>, 2017

The entire country is likely to experience mean summer temperature above the **climatological 1981-2010** average.

Uncertainties in regional predictions are higher for precipitation than for temperature. The probabilities for below-, near- or above- normal conditions are approximately equal in the entire Serbia. It should be noted that certain parts of the country, particularly mountain regions may receive near- or above-normal summer precipitation totals due to the episodes of enhanced convection accompanied by heavy precipitation.

Probability for summer temperature 2 m (%)	Probability for summer precipitation (%)
<b>Above-normal</b> (20, 30, 50)	<b>No signal</b> (33, 34, 33)
In the entire country	In the entire country

The numbers in brackets (left to right) are related to the values of meteorological parameters for: below-, near- and above- normal conditions.
