

Draft Version

**Twenty-seventh Session of
SOUTHEASTERN EUROPE CLIMATE OUTLOOK FORUM (SEECOF-27)
April-May, 2022**

**SEASONAL OUTLOOK FOR SUMMER SEASON 2022 FOR THE SOUTH
EASTERN EUROPE AND CAUCASUS REGION (SEE&C)**

Climate experts from WMO RA VI RCC Network Nodes on long-range forecasting (Meteo France, France and Roshydromet, Russia) and WMO RA VI RCC Network Node on climate monitoring (Deutscher Wetterdienst, Germany), UK Met-Office, Global Producing Centre ECMWF, International Research Institute for Climate and Society (IRI, USA), National Centers for Environmental Prediction (NCEP, USA), WMO RA VI RCC South East Europe Virtual Climate Change Centre (SEEVCCC, Serbia) and National Hydrometeorological Services of SEECOF region provided their valuable contribution to the successful implementation of SEECOF-27 by developing the relevant documents and providing scientific guidance and recommendations.

The SEECOF-27 comprised of the following Steps:

- Step 1: qualitative verification of the SEECOF-26 climate outlook for 2021-2022 Winter;
- Step 2: assessment of the current state of the climate including large-scale climate patterns worldwide and assessments of its likely evolution in the course of the next months;
- Step 3: building the consensus forecast for 2022 summer season.

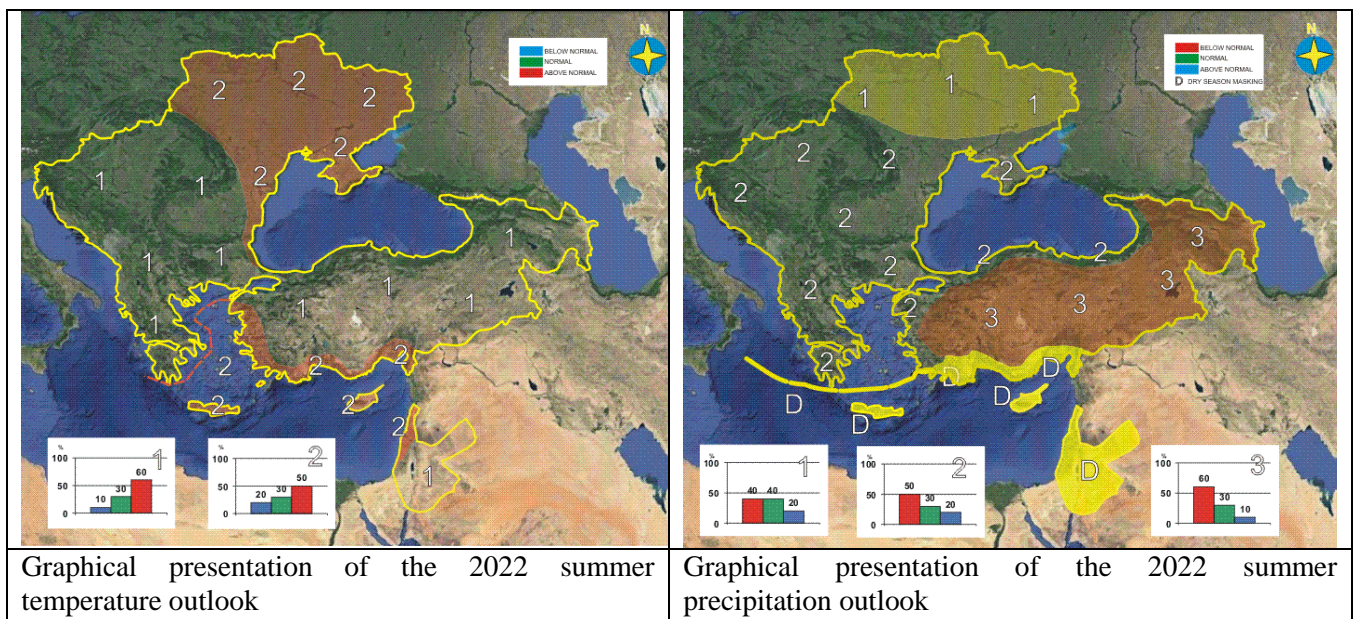

All relevant documentation is posted and updated in SEEVCCC web site: <http://www.seevccc.rs>

SEECOF-27 CLIMATE OUTLOOK FOR THE 2022 SUMMER SEASON

Similarly, to MedCOF-18 seasonal climate outlook, SEECOF-27 prediction is based on the output from dynamical models, including, inter alia, the operational products of the SEEVCCC centre, statistical models and teleconnections of large-scale climate features.

Observed sea surface temperatures and forecast for the coming three months show moderate la Niña conditions and negative Indian Ocean Dipole, while positive anomalies are taking place in the equatorial Atlantic. Most models show a typical atmospheric response to la Niña conditions, with good agreement for a negative PNA pattern. Over the Atlantic, a majority of models favour NAO+ and EA+ scenarios, so zonal circulation is expected to predominate. Soil is dry over north-western parts of the domain, which is associated with an enhancement of heat waves.

The maps show the probabilistic consensus forecast for the tercile categories of anomalies for seasonal mean temperature and precipitation, relative to the 1981-2010 period. Due to the climate-warming trend, anomalies are affected by the selected reference period.

In the entire SEECOF region, summer temperature is likely to be above-normal, with the probability increasing from the northern and north-eastern region, as well as from Aegean, Black and Eastern Mediterranean Sea (Zone 2 in Figure 1) to the remainder of the region (Zone 1 in Figure 1).

Uncertainties in regional predictions are higher for precipitation than for temperature. Most of the Ukraine is likely to experience below- or near-normal conditions in terms of summer precipitation sums. Most of the SEECOF region will receive below-normal precipitation sums with the probabilities increasing from the north-west (Zone 1 in Figure 2) towards east of the region (Zone 3 in Figure 2). It is noteworthy that certain parts of the country, particularly mountainous regions, might receive near- or above-normal summer precipitation totals due to the episodes of enhanced convection accompanied by heavy precipitation. Due to dry season masking, it is not possible to forecast summer precipitation totals along the eastern coasts of the Eastern Mediterranean, Crete, Israel and Jordan.

It should be noted that certain parts of the country, particularly mountain regions might receive near- or above-normal summer precipitation totals due to the episodes of enhanced convection accompanied by heavy precipitation. Due to dry season masking, it is not possible to forecast summer precipitation totals along the eastern coasts of Eastern Mediterranean, Crete, Israel and Jordan.

Reference:

The maps show the probabilistic consensus forecast for tercile categories of anomalies of seasonal-mean temperature and precipitation, relative to the 1981-2010 period.

Any further advice on the forecast signals, shorter-range updates and warnings will be available throughout the summer from the National Meteorological Services, along with the details on the methodology and skill of long-range predictions.

** The graphical representation of climate outlook in this statement is for guidance purposes only, and does not imply any opinion whatsoever concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries.*
